

catchup

CatchUp - the app about fun, friends and parties.

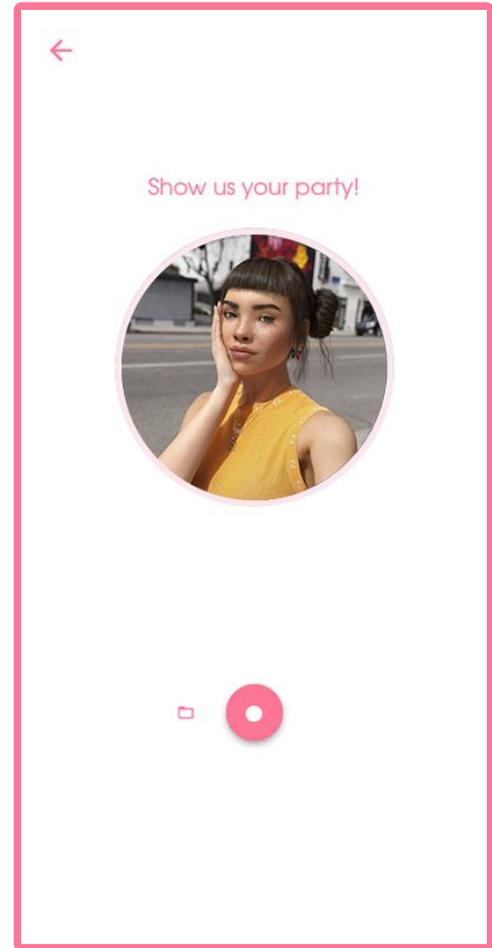

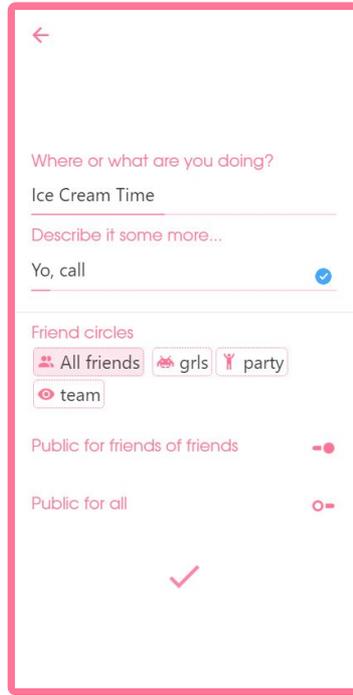

Our **primary objective** is a creation of organic and safe ecosystem, where users can share their real life activities with friends, so they can meet each other and continue communication.

As so, we have developed and tested a number of systems and approaches, both implemented in the current version of the application and planned for future releases.

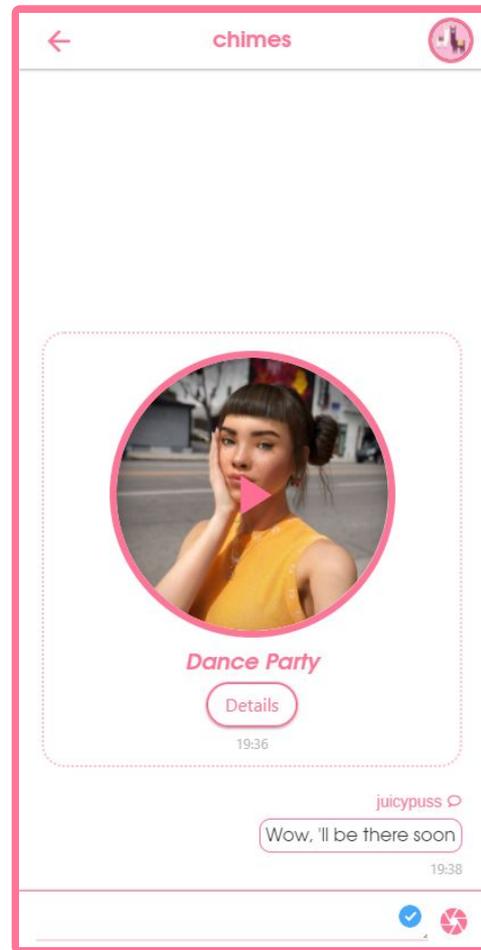

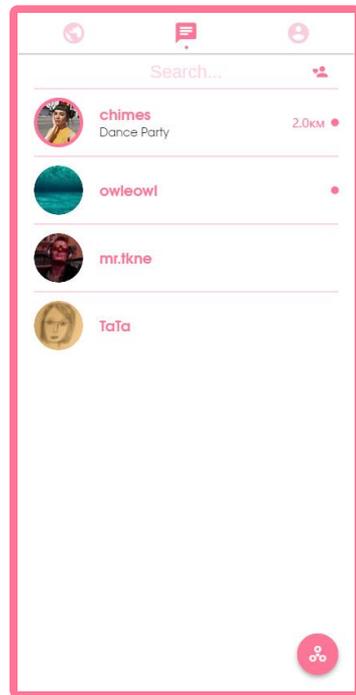

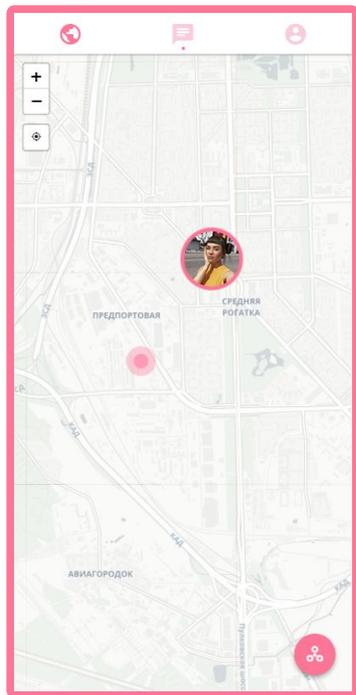

We made this project in will to see technologies unite people, making **space for a real life** in an endless stream of information.

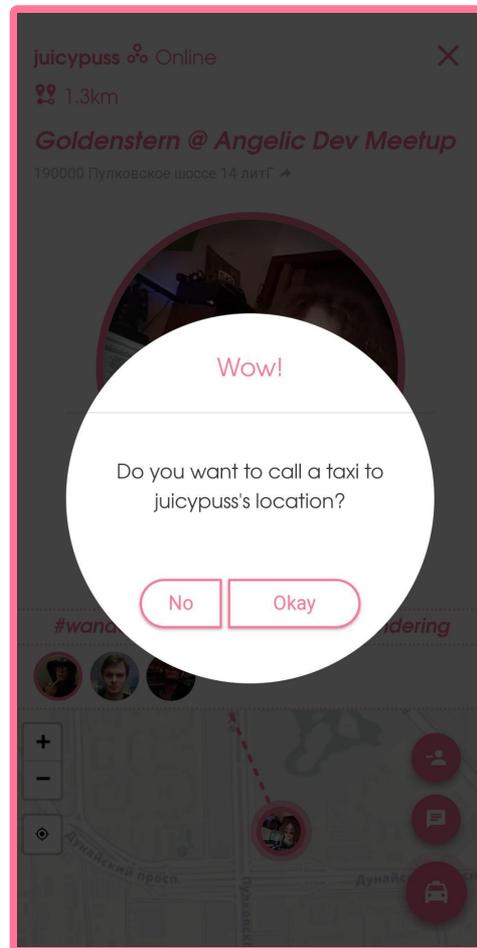

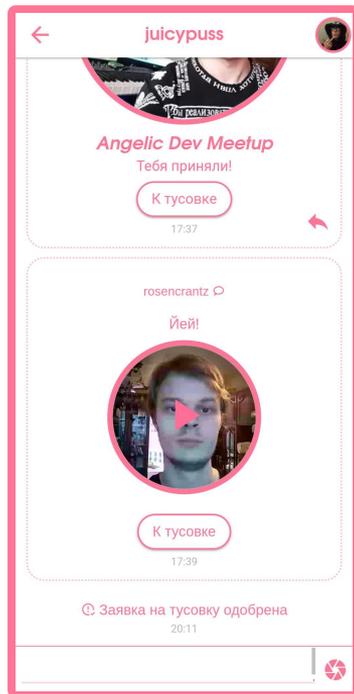

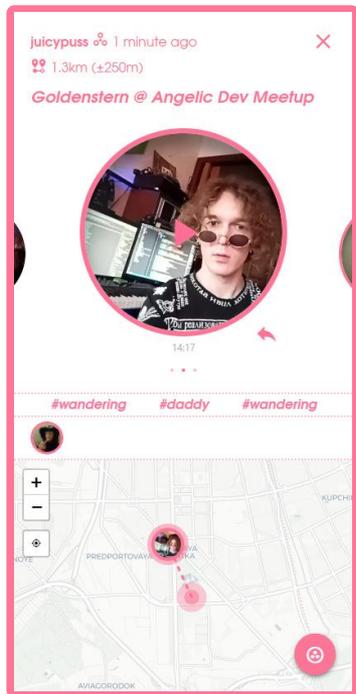

At a base level, CatchUp users can **visit** friends' activities and **share** their own.

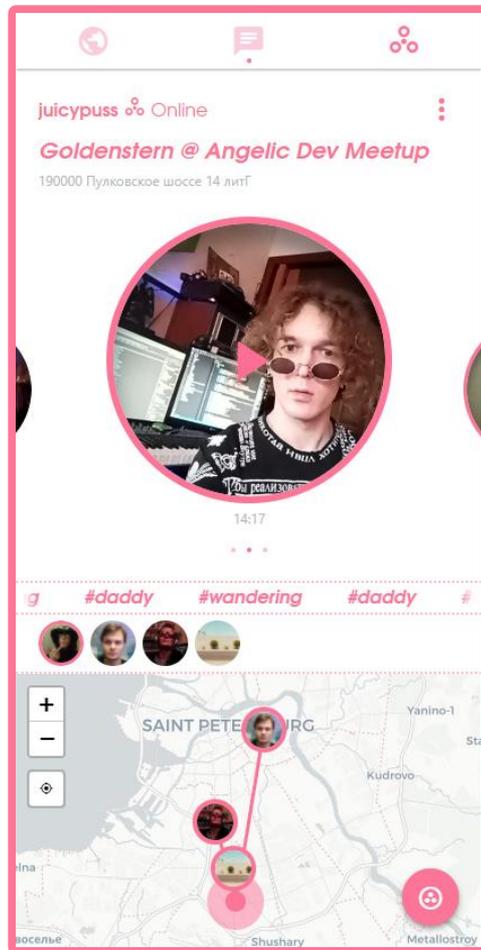

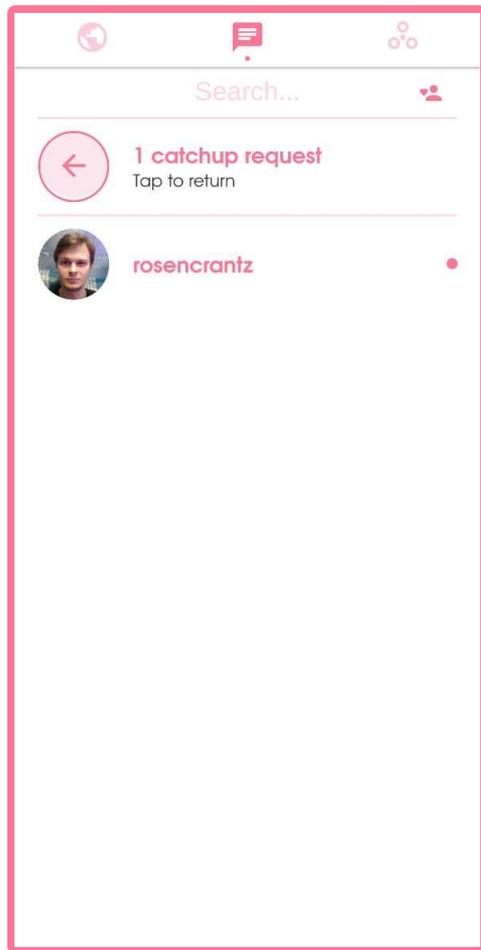

To share an activity, user record a short video story about current moment.

The user's friends receive a push notification with a new activity, and also see it on the map and in their chat tab.

Friends can watch the story and **join an activity** by sending a greeting. After approval, they can call a taxi to the activity address.

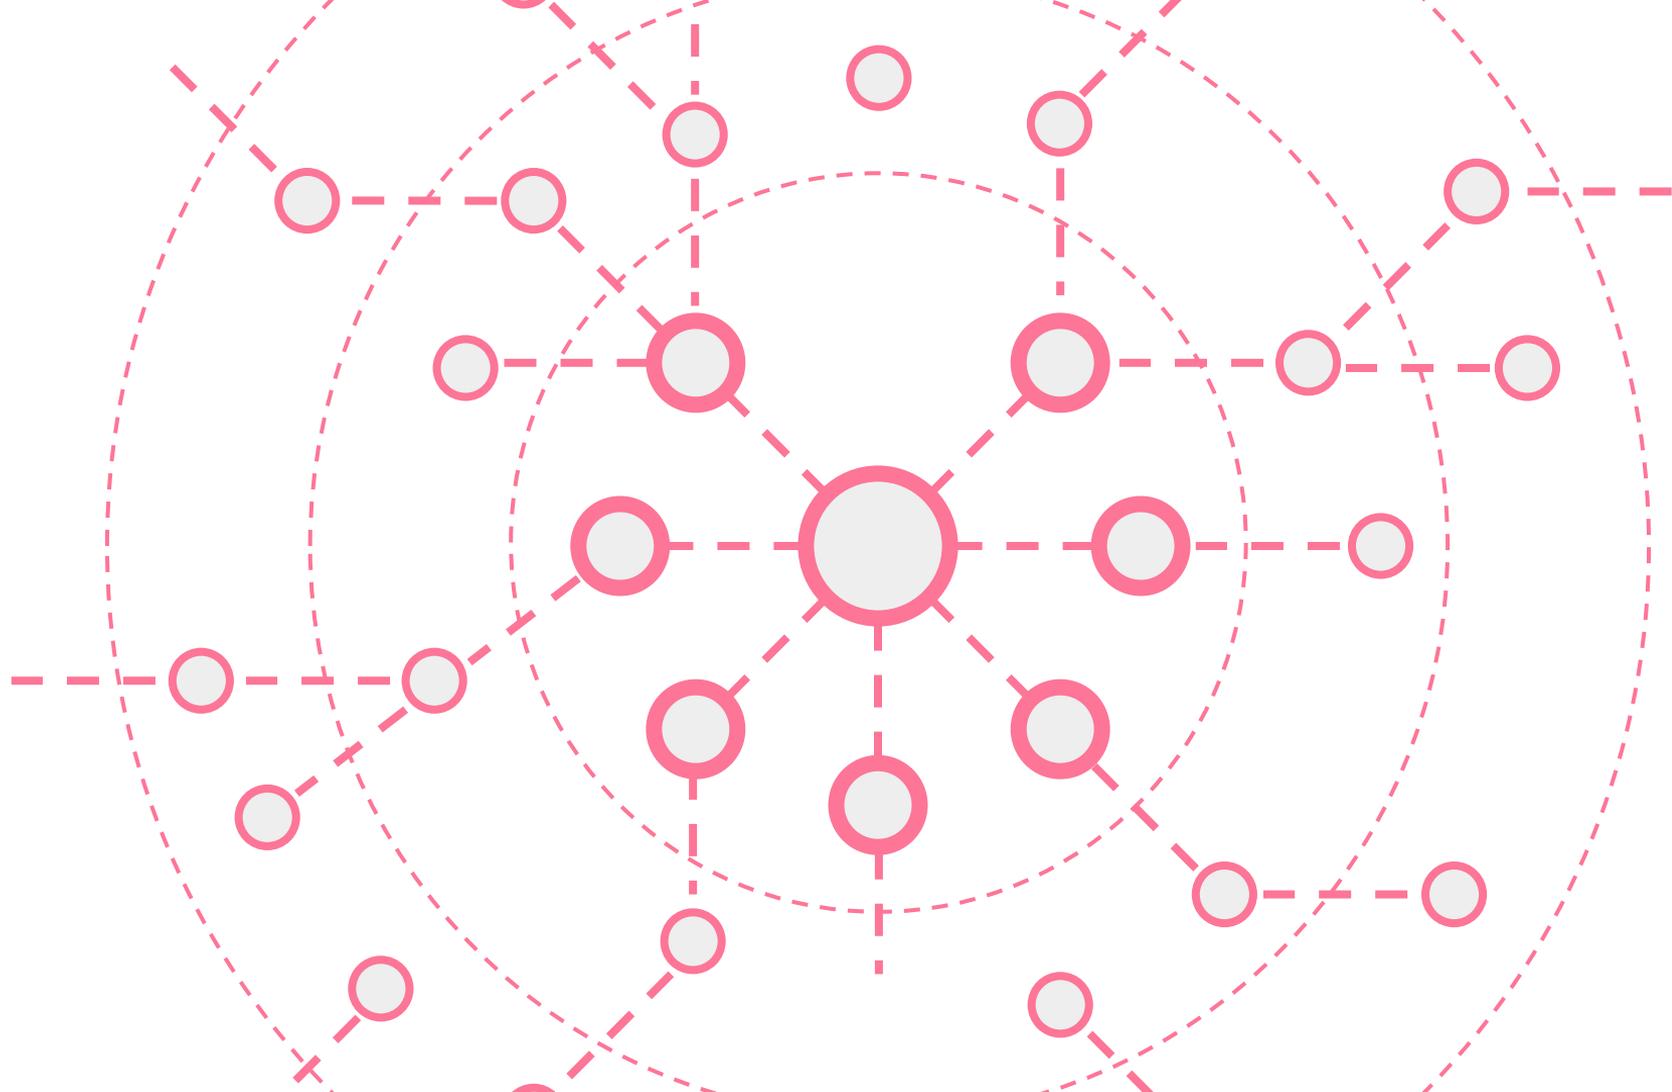

For a bigger fun, users can create **public activities** that are visible to:

- friends of the user's friends
- anyone (*experimental feature*)

The screenshot shows a mobile app interface for creating a public activity. At the top left is a back arrow. Below it is a text input field with the placeholder "Where or what are you doing?". The text "Pool party" is entered in this field. Below the input is a "Describe it some more..." section with a text input field containing ":P". Underneath is a "Friend circles" section with three buttons: "All friends", "Crew", and "Devs". Below this are two toggle switches: "Public for friends of friends" and "Public by hashtags", both currently turned off. At the bottom of the form is a "Check 'em before you go:" section with three hashtag buttons: "#techno", "#dance", and "#party". A large red checkmark is centered at the bottom of the form, indicating the activity has been successfully created.

Thus, a natural **sphere of interactions and activities** is organized around each member of the community, determined by his social circle. We call it the **multiverse**.

The most important factor during such interactions and acquaintances is the feeling of **security and transparency**, for which we have implemented the following mechanics.

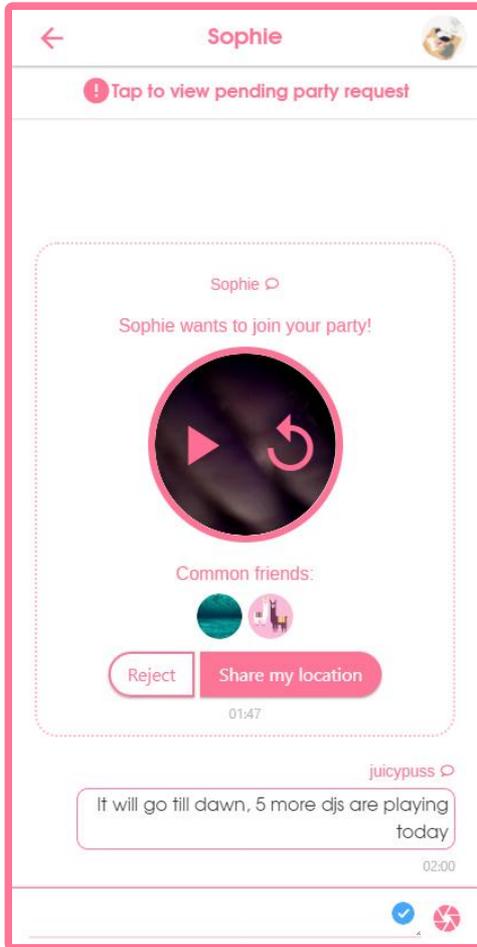

←

Enter your invite code:

LAVK2022

→

An **invite-only registration** and reputation systems is designed to keep out unreliable community members, making communication easy.

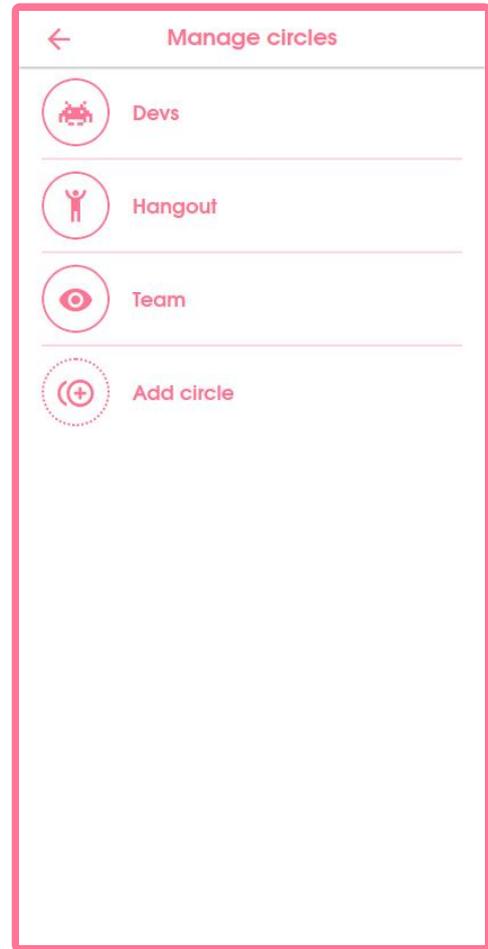

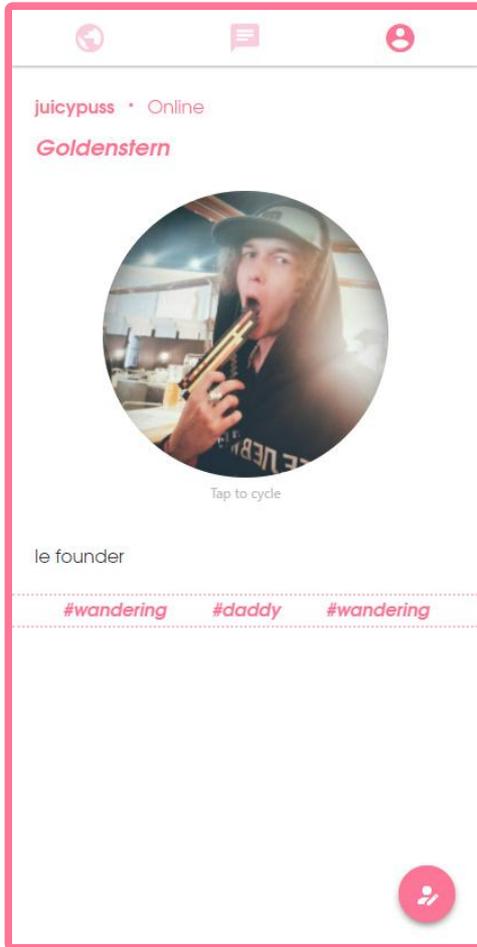

Video greetings and a list of common friends allow you to select who will participate in public events.

The exact **address and coordinates of an activity are hidden** from users until their participation is approved and exist only until the activity ended.

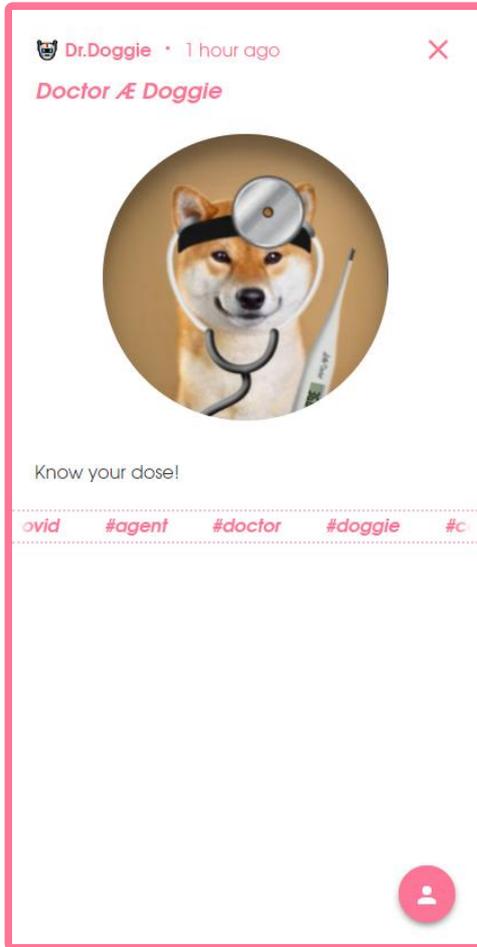

Users can **manage friends circles** and create events that are not visible for anyone.

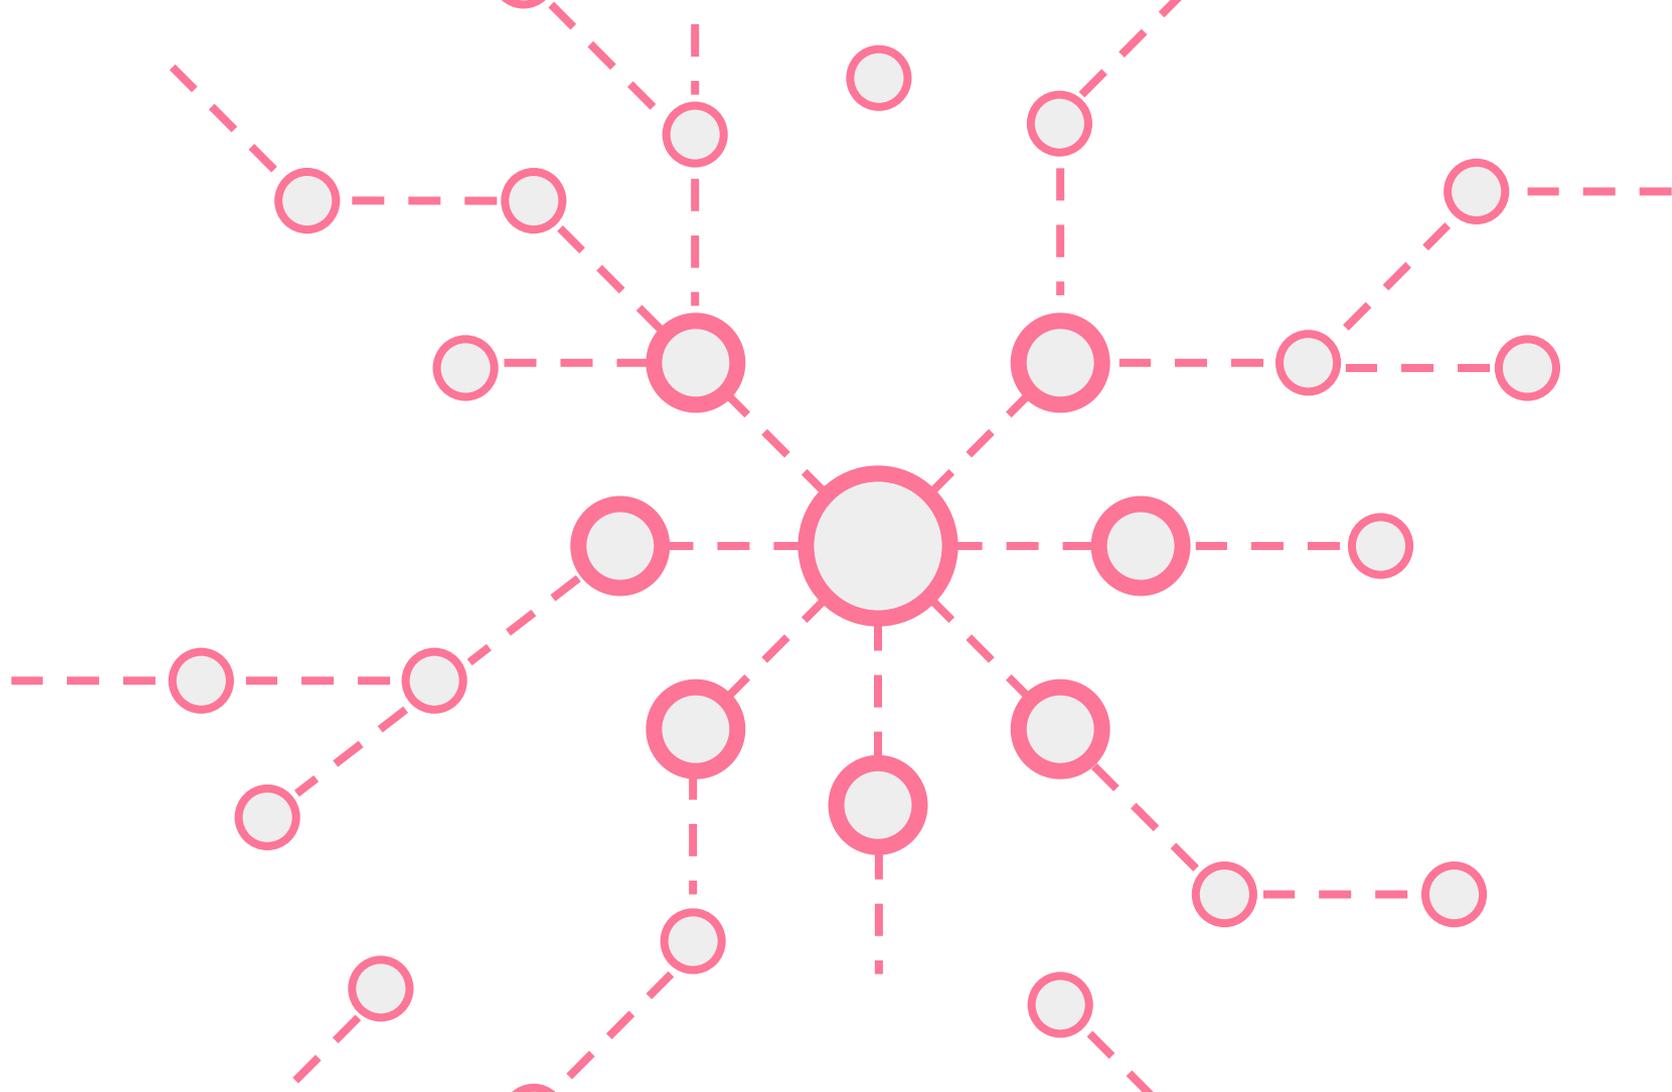

Video stories about past activities are **automatically hidden** from chats and profiles after 7 days.

While the situation with COVID is dangerous, a special bot helps to **contain the epidemic.**

The final element of our ecosystem is the **planned activities** based on the presented mechanics.

This module is in development

Also, there is a place for a business in CatchUp.

Companies can also **share their scheduled and live activities on the map**, using a separate advertising interface.
